

quarks and leptons halzen pdf

In particle physics, flavour or flavor refers to the species of an elementary particle. The Standard Model counts six flavours of quarks and six flavours of leptons. They are conventionally parameterized with flavour quantum numbers that are assigned to all subatomic particles. They can also be described by some of the family symmetries proposed for the quark-lepton generations.

In theoretical physics, quantum chromodynamics (QCD) is the theory of the strong interaction between quarks and gluons, the fundamental particles that make up composite hadrons such as the proton, neutron and pion. QCD is a type of quantum field theory called a non-abelian gauge theory, with symmetry group SU(3). The QCD analog of electric charge is a property called color.

Nuclear fusion is the only process reasonably capable of powering the sun, and one product of this fusion is invisible particles called 'neutrinos'. But why don't we observe as many solar neutrinos as theory would predict?

The Solar FAQ: Solar Neutrinos and Other Solar Oddities

L'interazione forte può essere osservata in scala piccola fra quark a formare i protoni, i neutroni e altre particelle, e in scala grande (dove si parla propriamente di "forza nucleare forte") fra protoni e fra neutroni a formare il nucleo dell'atomo. Nel primo caso le particelle mediatrici dell'interazione sono i gluoni, nel secondo i pioni.

modifier - modifier le code - modifier Wikidata L'Électron, un des composants de l'atome avec les neutrons et les protons, est une particule élémentaire qui possède une charge élémentaire de signe négatif. Il est fondamental en chimie, car il participe presque tous les types de réactions chimiques et constitue un élément primordial des liaisons présentes dans les molécules ...

Électron - Wikipedia

El físico alemán Johann Wilhelm Hittorf emprendió el estudio de la conductividad eléctrica de gases enrarecidos. En 1869, descubrió un brillo emitido desde el cátodo que aumentaba de tamaño cuando el gas disminuía de presión. En 1876, el también físico alemán Eugen Goldstein mostró que los rayos

de ese brillo proyectaban una sombra, y los denominÃ³ «rayos catÃ³dicos». [30]
